1.0 INTRODUCTION

Next13 PTY LTD has engaged Palmer Acoustics to perform field impact insulation tests at U609 Savvi Apartments, 35 Kelburn St, Upper Mt Gravatt. A standard tapping machine was positioned on the flooring samples/floors installed in the living, kitchen/dining room of Unit 609 on level 6. Receiving room noise levels were measured in the living, kitchen/dining room of Unit 509 on level 5 (directly beneath living, kitchen/dining room of Unit 609).

Floor systems tested:

- Test 1 Bare Concrete Slab
- Test 2 8mm thick Trojan Professional Hybrid flooring sample (rubber backing) with black plastic on 3mm thick Trojan IQ underlay
- Test 3 8mm thick Trojan Professional Hybrid flooring sample (rubber backing) with black plastic on slab

2.0 EQUIPMENT AND PROCEDURES

2.1 Measurement Procedures

Testing was in conformance with ISO 16283-2:2015 "Field measurement of impact sound insulation of floors". The evaluation of the results, to derive the single figure L'nT,w rating, was conducted to ISO 717-2 2013 "Rating of insulation in buildings and of building elements – Part 2 Impact Sound Insulation".

Each flooring sample/floor installed in the living, kitchen/dining room of Unit 609 was tapped in two (2) different orientations, with the receiving space's sound measurements averaged over 60 seconds periods - per test position.

The ambient sound levels were measured before testing, with the results assessed as per standard.

The receiving room reverberation measurements were taken with a Norsonics Sound Analyser Nor140, at four (4) locations throughout the space, with the results arithmetically averaged.

2.2 Instrumentation

The following instruments were used in the evaluation.

- NTI XL2 Sound Analyser (serial number A2A 08208 E0)
- B&K Type 3207 tapping machine EM50 (serial number 2574503)
- B & K 4231 Calibrator (serial number 2153030)

The sound level measuring equipment was field calibrated before and after each measurement session and was within 0.2dB of the reference signal. All instrumentation used in this assessment holds a current calibration certificate from a NATA accredited calibration laboratory.

3.0 DESCRIPTION OF ROOMS

All windows and doors were closed in the source room and receiving room.

Slab:	180mm thick concrete								
Transmitting Re	oom (Living, kitchen/dining Room of Unit 609 on Level 6)								
Test Floor:	Flooring samples/floors;								
Walls:	Plasterboard;								
Room finish:	Not finished.								

8 8 8	Receiving Room (Living, kitchen/dining Room of Unit 509 on L	evel 5.)
-------	--	---------	---

Ceiling:	13mm Plasterboard with 200mm ceiling cavity;
Floor:	Tile floor;
Walls:	Plasterboard;
Room finish:	Not finished.

Figure 1: (i) Test 1, **(ii)** Test 3

4.0 RESULTS

Our tests gave the following results:

Table 1: Test Result Summary – Floor impact tests

	Test System	L'nT,w	FIIC
1.	180mm Concrete Slab	64	36
2.	8mm thick Trojan Professional Hybrid flooring sample with black plastic on 3mm thick Trojan IQ underlay	49	57
3.	8mm thick Trojan Professional Hybrid flooring sample with black plastic on slab	49	57

Test Certificates detailing the 1/3 octave band results are provided in Appendix C to this report in terms of L'nT,w following ISO 717 - 2: 2013.

The L'nT,w term is used in the Building Code of Australia (BCA); see also Appendix A. It should be noted that L'nT,w is a weighted room noise level and that a lower number represents better performance.

FIIC is an ASTM term which represents a floor/ceiling assembly's ability to resist the transmission of impact noise. A higher value represents greater performance.

5.0 DISCUSSION

The following table shows the Trojan Professional Hybrid flooring samples' impact insulation rating improvement from the bare concrete slab (with plasterboard ceiling):

Flooring types	Δ L'nT,w
 Trojan Professional Hybrid flooring sample with black plastic on Trojan IQ underlay 	15
2. Trojan Professional Hybrid flooring sample with black plastic on slab	15

Under the National Construction Code Series 2016 (NCC) specifies a minimum sound insulation performance rating for floors. Compliance with this rating is demonstrated by compliance with Verification Methods FV5.1 (b) *'impact: a weighted standardised impact sound pressure level with spectrum adaptation term* (L'nT,w) *not more than 62 when determined under AS/ISO 717.2.'*

The 8mm thick Trojan Professional Hybrid flooring in the Savvi Apartments comply with NCC floor impact rating.

Under the Association of Australian Acoustics Consultants (AAAC) "Guideline for Apartment and Townhouse Acoustic Rating" (re: www.aaac.org.au) an L'nT,w rating of 65 represents a 2 star level of quality, L'nT,w rating of 55 represents a 3 star level of quality, L'nT,w 50 represents 4-star and L'nT,w 45 represents 5-star performance.

- 2 Star L'nT,w 65
- 3 Star L'nT,w 55
- 4 Star L'nT,w 50
- 5 Star L'nT,w 45

APPENDIX A

GLOSSARY

IMPACT MEASUREMENT AND ASSESSMENT DESCRIPTORS

- *L_{Aeq,T}* Time average A-weighted sound pressure level is the average energy equivalent level of the A-Weighted sound over a period "T".
- *L_{Aeq}* Equivalent Continuous Noise Level. The noise level in dB(A), which is present for the entire measurement period, would produce the same sound energy to be received as was actually received as a result of a signal which varied with time. Normally abbreviated to "L_{eq}" or "L_{Aeq}", often followed by a specification of the time period (such as 1 hour or 8 hours) indicating the period of time to which the measured value has been normalized;
- *L'_{nT,w}* Weighted Standardised impact sound pressure level; a measurement of impact sound transmission between rooms. Lower values denote better performance. The single figure measure is derived by adapting a standard response curve to measure 1/3 octave band sound pressure levels. Measured results are adjusted based upon a reverberation time of 0.5 sec in the receiving room. Normally derived from a field test.
- L'_{n,w} Weighted Normalized impact sound pressure level; a laboratory measurement of impact sound transmission between rooms. Lower values denote better performance. The single figure measure is derived by adapting a standard response curve to measure 1/3 octave band sound pressure level measurements. Measured results are adjusted based on the absorption of 10m² in the receiving room. Normally derived from a laboratory test.
- *Ci* A spectrum adaptation term compensating for the effect of floor coverings when applied to bare floors under test. The usually negative value, in decibels, is added to the single-number quantity, L'nw or L'nT,w.
- *L'nt Standardised Impact Sound Pressure Level* the impact sound pressure level is standardised to room with a reference reverberation time of 0.5 seconds.
- *L'_n Normalized Impact Sound Pressure Level* the impact sound pressure level normalized to reference absorption area of 10 metric sabins (108 sabins).
- *Field Impact Insulation Class (FIIC)* a single-number rating derived from measured values of normalized one-third octave band impact sound pressure levels in accordance with Eq 4 and the reference contours in Classification E 989. It provides an estimate of the sound insulating performance of a floor-ceiling assembly and associated support structures under tapping machine excitation.
- *Impact Insulation Class (IIC)* This classification covers the determination of a single-figure rating that can be used for comparing floor-ceiling assemblies for general building design purposes.

- *Impact Sound Pressure Level (L)* the average sound pressure level in a specified frequency band produced in the receiving room by the operation of the standard tapping machine on the floor assembly, averaged over each of the specified machine positions.
- *Receiving room* a room below or adjacent to the floor specimen under test in which the impact sound pressure levels are measured.
- *Source Room* the room containing the tapping machine.

STANDARDS

• ISO 16283 – 2

Acoustics – Field measurement of sound insulation in buildings and of building elements – Part 7: Default procedure for sound pressure level measurement

• ISO 717 – 2

Acoustics – Rating of sound insulation in building and of building elements – Part 2: Impact sound insulation

• ISO 3382-2:2008

Acoustics – Measurement of room acoustic parameters — Part 2: Reverberation time in ordinary rooms.

- ASTM Classification E 1007 97
 Standard Test Method for Field Measurement of Tapping Machine Impact Sound Transmission Through Floor-Ceiling Assemblies and Associated Support Structures
- ASTM Classification E 989 89 Standard Classification for Determination of Impact Insulation Class (IIC)

APPENDIX B

CALCULATION METHODOLOGY - L'nT,w

Standardized impact sound pressure level – ISO 16283-2:2015

 $L'_{\mathrm{n}T} = L_{\mathrm{i}} - 10 \log \left(\frac{T}{T_0}\right)$

 L'_{nT} is the standardized impact sound pressure level; L_i is the impact sound pressure level; T is the reverberation time in the receiving room; T_0 is the reference reverberation time in the receiving room; for dwellings, $T_0 = 0.5$ s.

Method of comparison - ISO 717-2:2013

To evaluate the results of a measurement of L'_{nT} in one-third-octave bands, the reference curve is shifted in increments of 1 dB towards the L'_{nT} curve until the sum of unfavorable deviations is as large as possible but not more than 32 dB.

An unfavorable deviation at a particular frequency occurs when the results of measurements exceed the reference value. Only the unfavorable deviations are taken into account.

The value, in decibels, of the reference curve at 500 Hz, after shifting in accordance with this procedure, is $L'_{nT,w}$.

Correction to the signal level for background noise - ISO 16283-2:2015

If $(L_{sb}-L_b) > 10$, then $L = L_{sb}$ If $10 > (L_{sb}-L_b) > 6$, then $L = 10 \log \left(10^{\frac{L_{sb}}{10}} - 10^{\frac{L_b}{10}}\right)$ If $6 > (L_{sb}-L_b)$, then $L = L_{sb} - 1.3$

L is the adjusted signal level, in decibels; $L_{\rm sb}$ is the level of signal and background noise combined, in decibels; $L_{\rm b}$ is the background noise level in decibels.

CALCULATION METHODOLOGY - FIIC

Correction to the signal level for background noise - ASTM E 1007 - 97

If $(L_{sb}-L_b) > 10$, then $L_s = L_{sb}$ If $10 > (L_{sb}-L_b) > 5$, then $L_s = 10 \log \left(10^{\frac{L_{sb}}{10}} - 10^{\frac{L_b}{10}}\right)$ If $5 > (L_{sb}-L_b)$, then $L_s = L_{sb} - 2$

 $L_{\rm s}$ is the adjusted signal level, in decibels;

 L_{sb} is the level of signal and background noise combined, in decibels; L_b is the background noise level, in decibels.

Normalized impact sound pressure level - ASTM E 1007 - 97

$$L_{\rm n} = L_{\rm p} - 10 \log \left(\frac{A_0}{A_2}\right)$$

 $A_2 = 0.921 \, \left(\frac{Vd}{c}\right)$

 L_n = normalized impact sound pressure level;

 L_p = average one-third octave band sound pressure level;

 A_2 = equivalent sound absorption area of the room, in m²;

 A_0 = reference sound absorption area of the room, A_0 = 10 m²;

V = volume of the room, in m²;

d = rate of decay of sound pressure level in the room, in dB/s (d = 60/T, T = reverberation time);

c = speed of the sound in air, in m/s ($c = 20.047\sqrt{273.15 + t}$, *t* = receiving room's temperature).

Determination of Impact Insulation Class - ASTM E 989 - 1999

To determine the impact insulation class (IIC) of a floor-ceiling assembly, the reference IIC contour is shifted vertically relative to the normalised impact sound pressure levels until the following conditions are fulfilled:

- The sum of the deviations above the contour do not exceed 32 dB
- The maximum deviation at a single test frequency do not exceed 8 dB

The normalised sound pressure level at the intersection of the contour and 500 Hz ordinate is subtracted from 110 to obtain the impact insulation class.
